SAHIL NANGARE

Data Analyst | Fintech & Transaction Analytics

7666813978 | sahilnangare892001@gmail.com | linkedin.com/in/sahil-nangare/ | github.com/Sahil892001

PROFESSIONAL SUMMARY

Data Analyst with 2+ years of experience transforming large-scale transaction data into business impact — including recovering ₹20L/day in failed transactions and reducing reconciliation time by 87%. Proficient in SQL, Python, and BI tools (Tableau/Power BI), with hands-on experience in automation, anomaly detection, and data pipelines. Open to roles across fintech, product, and data-driven organizations.

TECHNICAL SKILLS

Languages & Analysis: SQL (Advanced: Joins, Window Functions, CTEs), Python (pandas, NumPy, scikit-learn), PySpark, HiveQL

Analytics & Visualization: A/B Testing, Hypothesis Testing, Regression Analysis, Cohort Analysis, Tableau, Power BI, Excel

Engineering & Tools: ETL Pipelines, Data Cleaning & Transformation, Batch Processing, Data Validation/Reconciliation, MySQL, Oracle, JIRA, Confluence

PROFESSIONAL EXPERIENCE

Jio Platforms Limited — Data Analyst | Dec 2023 – Present

- Identified a 3.2% failure rate spike on Emitra TPA channel by analyzing 45 days of transaction logs in SQL across error codes and time segments — root cause escalated and resolved, recovering ~₹20L/day in recharge transaction value.
- Built a Python-pandas reconciliation pipeline matching internal recharge records against TPA partner settlement files daily — reduced reconciliation time from 5 hours to 40 minutes and surfaced ₹3.5L/month in undetected settlement discrepancies.
- Developed a 30-day rolling wallet depletion model in Python across 80,000+ agents in a 5-tier distribution hierarchy — reduced zero-balance retailer downtime incidents by 28% through early-warning alerts to field teams.
- Designed a Z-score anomaly detection model in Python on 7-day transaction baselines across 22 telecom circles — cut average anomaly detection time from 3 hours to under 45 minutes, flagging 14 revenue-impacting incidents over 3 months.
- Conducted 12-month SQL cohort analysis on agent transaction history across 80,000+ retailers — identified that 22% of agents contributed <0.3% of GMV, enabling field teams to reduce activation campaign scope by 60% while targeting highest-value dormant segments.

PROJECTS

Unit Economics & Profitability Diagnostics Platform (*Tech Stack: **Python**, Pandas, NumPy, SQLite, Streamlit)*

- Built end-to-end analytics pipeline processing 200K orders across 20K customers — automated data quality validation, feature engineering, and SQLite loading, reducing manual analysis time and enabling reproducible insights at scale.
- Diagnosed a 21pp margin collapse (+13.7% to -7.5%) using SQL cohort analysis, CAC/LTV modeling, and segment profitability diagnostics across 4 acquisition channels and 3 service types — identified Paid Search CAC of ₹309 against -₹9.67 LTV as the primary value destruction driver.
- Built a scenario modeling engine (Scenario Engine class) quantifying the financial impact of 17 strategic interventions — projected ₹23L margin improvement through combined pricing, cost reduction, and order strategy levers — presented via interactive 5-tab Streamlit dashboard deployed on Streamlit Cloud.

Finance Analyzer – Payment App Spending Analysis (*Tech Stack: **Python**, Pandas, matplotlib Streamlit)*

- Built end-to-end pipeline extracting, cleaning, and analyzing 20,000+ transactions from PDF statements — engineered features across monthly trends, category spend, and weekend vs. weekday segmentation.
- Deployed a production Streamlit application with interactive dashboards, spend pattern visualizations, and downloadable enriched datasets.

CERTIFICATION

Google Data Analytics Professional Certificate — Coursera (Google)

EDUCATION

Bachelor of Engineering in Computer Engineering 2019 – 2023

Sinhgad College of Engineering | CGPA: 8.77
